						R350.04

Insulation's effectiveness in restricting the flow of heat is measured by its R Value. The higher the material's R value, the greater the material's heat insulation effectiveness and slower the heat flow through it.

### SANS 10400-XA Energy Efficiency in New Buildings

The energy efficiency legislation for new buildings SANS 10400-XA has been published by the regulator (NRCS). All new buildings will have to comply with the performance parameters, which means that insulation will have to be installed to achieve the stipulated R-values.

#### Part K: Walls

##### External Walls SANS 10400-XA

Light weight (Non brick/Non concrete) walls must achieve a minimum R-value:

of 2.2 for climatic zones 1&6

of 1.9 for climatic zones 2,3,4&5

Masonry walls (Brick/Concrete) must achieve a minimum R-value of 0.35

for climatic zones 1 to 6
